

## **Software Update for iPod Interfaces** (for software version 5616 or higher)

Step-by-step update directions:

1. Download the config file (MP3) you need for your radio (Basic, TXT, MD, Specific, AP).
2. Use iTunes to store the MP3 tracks in a new playlist on the iPod.
3. Switch on the car radio with the interface connected (but do not hook up the iPod to the interface).
4. Start manual playback of the MP3 tracks on the iPod.
5. Connect the interface with the iPod (via the dock connector), the update will start automatically.
6. The following message will appear on the iPod display once the update has been successfully completed: Config updated, please restart radio.
7. Once the update has been successfully completed, please switch off the radio.
8. Unplug the iPod from the interface; delete the config file from the iPod.
9. Switch the radio back on after a two-minute waiting period.

Now your update is complete. When you restart the iPod, the display will show the new configuration name on the left beside the software version (SWxxxx).

## **Configuration of Volume-level-Adjustment (only for the iPod interface 7 607 540 501):**

1. Download LS-config file (MP3 format)
2. Save config via iTunes in a new playlist on your iPod
3. Connect interface first and then switch on your car radio. Choose CDC-source (iPod still disconnected)
4. Start the downloaded LS-config file manually from the playlist
5. Connect iPod with the interface via dock-connector. Update starts automatically.
6. "Volume" will appear on the radio display after a while (if CD-Text is supported). The iPod should display "change Volume", "restart radio", "to save config".
7. Now the volume level setting which is split into 16 stages can be controlled by using the track up/down buttons. The audio signal played back during the configuration adjusts its level in real time which means that your adjustments are audible straight away.
8. Once the desired volume level is set by using the track up/down buttons the radio can be switched off.
9. Disconnect the iPod from the interface and delete LS-config file via iTunes from the iPod.
10. Create music in the playlists as described in the manual.
11. Enjoy listening to your music in the car!

Note: The volume level settings have been transferred and saved onto the interface automatically!
